

Surface insights of how your business applications are used to drive productivity, adoption and ROI

01 Challenges

Our sales reps aren't using CRM as they should or following processes we put in place, but we need more detail by process and user to pinpoint training needs

We are considering migrating to a better software app but need to understand what features are most commonly used in the legacy system so we know what to keep and improve

We have invested in a new ERP and are in a pilot, before we go further we want to understand adoption to see ROI and identify training for the wider implementation

02 What are LLMs (Large Language Models)?

An LLM is Generative AI technology applied to text, these models are able not only to work in a question-answer flow, but also to perform natural language tasks such as creating paths and tasks from your explained processes, removing the need for technical expertise.

03 What is AI User Insights?

AI User Insights is a system integrated with Microsoft Dynamics 365 apps that automatically records user activities within the apps and provides an interactive platform with intuitive visualizations.

Available out-of-the-box and integrated directly within your familiar Microsoft Dynamics 365 ERP (Business Central and Finance & Supply Chain Management) and CRM (Customer Engagement) applications.
